

ABSTRACT OF THE DISCLOSURE

[0237] Embodiments of the present invention relate to methods and systems for directing data packets to network applications. In an embodiment, a first data packet is received via a first network interface and contains a first data packet service address. A first network application of a plurality of network applications is identified based at least in part on the first network interface and the first data packet service address. The plurality of network applications include a second network application, where the first network application is different from the second network application. At least a portion of the first data packet is sent to the first network application.
